GTM Engineer / AI Marketing Engineer

Marketer who builds the internal tools. Ten years across paid media, SEO, analytics and CRM operations, the last two spent engineering the GTM infrastructure rather than operating it by hand. I built the attribution model that let an energy client measure true cost per enrollment for the first time, across paid, direct mail, calls and offline enrollment data. The channel audit run through it showed **101% ROI on \$76,279 of spend**: \$153,610 revenue, 594 enrollments at \$128.45 each. I designed, built and run a production autonomous agent platform in Python that works alongside me across a five property book, handling execution while I own the strategy and the client relationships: 28 agents, 385 agent callable tools, 96 scheduled jobs, 5,859 tests passing. I write the attribution layer too, including Google Tag Manager custom JavaScript, offline conversion pipelines through the Google Ads API, and Customer Match through Google's Data Manager API. I am winding the agency down to do this in house, where I can build one system properly instead of five in parallel.

RESULTS

Outcomes from published client work. Clients anonymized by agreement.

- **101% ROI** measured on a \$76,279 channel mix (energy): \$153,610 revenue, \$77,330 net profit, 594 enrollments at \$128.45 each. The number came out of the attribution model I built, which was the first thing that could tell a lead from an actual enrollment at this account.
 - **85% CPA reduction** with 65% growth on a healthcare e-commerce account.
 - **42.6% conversion rate** on a rebuilt landing page: 1,662 conversions at \$139 each.
 - **+349.7% conversion rate** from listing-level SEO for a real estate client.
 - **+113% increase in Google Business Profile interactions** for a multi-location energy client.
 - **\$508,916 in new sales** from a direct mail program, and a retargeting variant that produced a 5x response lift with 33% call-to-sale conversion.
-

SELECTED ENGINEERING WORK

Autonomous marketing agent platform

(Python, Claude Agent SDK, Postgres, pgvector)

Solo build, 462 merged pull requests and 706 commits in 83 days.

- 28 specialized agents, 24 with production run history, coordinated through structured JSON handoffs in Postgres rather than free form chat. 139 distinct task types executed. These are internal tools for a GTM team: lead routing, enrichment, outbound, reporting and publishing run through deterministic and LLM-judged pipelines, escalating to me only on a compliance or quality violation. Spend increases and monthly report releases need my sign-off first.
- 385 agent callable tools wrapping 35+ external platforms with real API calls: Google Ads, GA4, Search Console, Tag Manager, Business Profile, HubSpot, Stripe, QuickBooks, Supabase, WordPress, Cloudflare, Slack, DataForSEO, CallTrackingMetrics and others.
- 46 table Postgres schema with pgvector semantic memory behind a swappable embedding interface.
- Safety architecture: 30 database backed kill switch flags where irreversible writes fail closed on an unseeded flag, plus a deterministic compliance gate that has fired 873 flags, 317 auto sanitizations and 146 hard blocks in production.
- 96 scheduled jobs in production. 31 run deterministically with no model call, which is the cost control: total inference across the full history is \$2,753 API equivalent. 5,859 tests passing. Python 3.13, pytest, ruff, mypy strict.

Promo code channel attribution, retail electricity provider

(GTM, GA4, JavaScript)

- Built channel level promo code attribution as four Tag Manager custom JavaScript variables mapping 1,177 promo codes across four acquisition segments into GA4.
- Audited the live container and found three data quality defects hand maintenance had introduced, including 69 duplicated entries and a cross segment collision that double fired attribution.
- Diagnosed why promo code never appeared on conversions: the parameter is event scoped, so it rides page code events only and reads as not set on 100% of the 17,181 key events measured year to date. Specified the user scoped replacement.
- Shipped the write path that removes the manual step: a GTM publish engine with workspace pinning, a foreign change guard, per variable safety checks and 33 tests. Also deployed the OpenAI Ads pixel and five conversion events through the GTM API, then removed one after proving it double counted.

Offline conversion and audience pipelines, energy retailer

(Google Ads API, Data Manager API)

- Root caused two conversion actions sitting at zero conversions for their entire lifetime: the source rows had never been connected to an import. Built an API uploader, now running as a daily cadence since June 2026 with a dedupe ledger holding 4,220 unique order IDs.
- Created a primary conversion action through the Ads API for zip code form leads, with a fail closed uploader that pushes only hand verified click IDs.
- Built Customer Match audience sync on Google's Data Manager API after the Ads API path was blocked. First live ingest loaded 28,032 members, split into solar and non solar segments.
- Reported enrollment ROI against the client's commission model: January 2026 delivered 350 enrollments on \$63,474 of total cost for \$24,166 net profit, a 38.1% return.

TexasCommercialPlans.com

(Supabase, Stripe, Python)

Shipped a commercial electricity price comparison product end to end, solo.

- Automated plan scraper into a Supabase data layer: 8,651 plan records, 148 retail providers, 27,434 price history rows. Raised pricing coverage from 88% to 100% with a PDF parsing fallback for Electricity Facts Labels.
- Stripe checkout and 11 Supabase Edge Functions covering payment, fulfillment, API access and lifecycle email.

EXPERIENCE

Matt Kundo Digital Marketing, Austin, TX

Founder and Principal · Jul 2018 to Present

Full stack growth ownership for a portfolio of client and owned properties, including paid media, SEO, analytics engineering, CRM operations and web development, with direct P&L responsibility.

- Embedded as SEO and SEM consultant with a retail electricity provider, owning CRM operations (a HubSpot portal where I scanned 3,508 contacts and triaged 58 duplicate groups into a reviewed merge plan), competitive price position reporting in Power BI against Azure SQL, and site deploys on WP Engine.
- Built and shipped client side conversion instrumentation, including referral code auto population with input format guarding, deployed and verified in production.

Rebel Interactive Group

Marketing Strategist, SEO and Media Specialist · Feb 2017 to Jul 2018

FlexTekk, Middleborough, MA

Marketing and Sales Manager · Sep 2015 to Jan 2017

Lucky Robot, Austin, TX

Marketing Coordinator · Jul 2013 to Jul 2015

TECHNICAL

Python 3.13, SQL, JavaScript · Postgres and Supabase, pgvector · Claude Agent SDK, LLM orchestration, RAG · Google Tag Manager (API and custom JavaScript), GA4 (including the Data API), Google Ads API, Google Data Manager API, Search Console · HubSpot API, Stripe, QuickBooks API, CallTrackingMetrics · Power BI, Azure SQL, DataForSEO · WordPress and WP Engine, Cloudflare, Netlify · pytest, ruff, mypy, git, GitHub Actions, launchd
